where you can download a growing library of mods and maps for the game The King of Fighters 2002. KOF2002.Q: XML Parsing from Soap Response not working on my iPhone I am using the System Software Version 9.2.1 and I am trying to parse an XML from a response generated by a SOAP request. This is the XML returned: 2015-03-18T12:02:53Z Success The problem is that the data returned in the XML is successfully decoded by the iPhone, but the string returned from the parsing is always null. Anyone has an idea about what's happening? Here 0cc13bf012

My team has finished a successful deployment, and is about to go into production. We have a single domain, and we want to set up "recovery" features, whereby we'd like to have a backup of all the data in case of failure. We have a table "customer_data" which has a unique "customer_id" column. The unique constraints prevent duplicate customer_id, but the intent was that the values in this column could be more generally defined, so for instance we could store a URL, along with the id, which uniquely identifies a given customer. The problem is that I'm not super keen on storing the URLs in the database. So, I'd like to store them in a service, and I'd like to be able to use that service to create a soft delete, so that I can query the "customer_data" table, and check to see if "customer_id" exists, and if it doesn't, then I'd like to delete the

THE KING OF FIGHTERS 2002 ULTIMATE MATCH REFERENCE MANUAL for DOS/Windows.The present invention relates to a lifting device and, more particularly, to a device for lifting and balancing loads. It is well known that in order to lift heavy loads, particularly containers, a lifting device must be provided to lift the load. A common lifting device is shown in U.S. Pat. No. 3,488,729 granted to Briles on Jan. 6, 1970. Although such a lifting device is capable of performing its intended function, there are several drawbacks. For example, the device of the Briles patent includes a plurality of tubulars that are connected together to form an open loop. The load is placed in the loop and the lifting device is then placed in a position on the ground, such as by being placed on a forklift. As such, the loop is free to move relative to the ground. The weight of the load, however, must be transferred to the ground by the loop. As a result, the loop must have sufficient strength to resist the load. In addition, the weight of the load is increased by the number of tubulars connected together to form the loop. Another prior art lifting device is shown in U.S. Pat. No. 5,282,978 granted to Iversen on Jan. 25, 1994. The Iversen lifting device includes an open-ended circular frame having a plurality of cross members. The frame is placed about a cylinder tube and a spindle is inserted in the tube. A second spindle is then inserted in the frame. A load is placed on the second spindle and the lifting device is positioned on the ground to lift the load. However, this lifting device is limited in that the load must be centered over the cylinder tube. If the load is not centered over the cylinder tube, then the device will not function as intended.
