We examined the effect of retinol and beta-carotene on thyroid hormone (T3)-responsiveness of thyroid hormone receptors (TRs) in vivo. Intraperitoneal

injection of retinol, but not beta-carotene, increased T3-responsiveness of nuclear TRs. Furthermore, T3-responsiveness of nuclear TRs was increased by preadministration of retinol, but not beta-carotene, in retinol-deficient rats. In liver homogenates of the rats, nuclear retinoic acid receptor (RAR) and retinol-binding protein 4 (RBP4) were

increased by preadministration of retinol and retinoic acid (RA), respectively. In contrast, beta-carotene did not increase these proteins. In retinol-deficient rats, RBP4 increased the nuclear RAR. Thus, retinol, but not beta-carotene, facilitates the activation of nuclear TRs via formation of a complex of nuclear RAR and RBP4 in

Epidermal keratinocytes in primary cultures were studied to determine if changes could be detected in the in vitro culture of lesional psoriatic keratinocytes. Cells from epidermis of psoriatic lesions were plated on glass coverslips and stained with hematoxylin and eosin. Compared to normal

keratinocytes cultured under similar conditions, cultured lesional keratinocytes demonstrated abnormal stratification and premature differentiation. The resulting multilayered cells were also enlarged and rounded in shape. These changes may be important in the etiology and pathogenesis of psoriasis. Label lines to represent 3D surfaces. 3D drawing information is now accessible in the status bar. Text 3D: New 3D text tools include measures, align with, and rotate. Text 3D is more

versatile. It can be used with multiple fonts and styles, and it supports more 3D effects. Text 3D tools are available in the ribbon and the application bar. Text 3D is an effective way to annotate drawings. Spatial Editing: New features for editing and manipulating spatial data include the following:

- Support for editing and selecting spatial data in 2D

and 3D. WYSIWYG editing for spatial data. Drawing control is available for geometric data. GIS-style editing and visualization of spatial data. Editing and visualizing terrain models. Reorganization of data: 3D coordinate data can be sorted in any order. Planned feature: Drag and drop support for 3
