First Things First: 2 Reasons Why Autodesk is an Amazing Stock Why You Need AutoCAD AutoCAD can be thought of as a drafting program. To create a CAD drawing, you first create a drawing object. Next, you use the drawing tools to lay out the objects on your drawing paper (model). Once you're satisfied with the drawing, you can save it. The resulting file is a DWG (or DWF) file. After some initial setup, such as choosing the page orientation (landscape or portrait) and paper size (i.e., portrait or landscape), you will want to start with a basic drawing. A common step is to make a 2D section through your drawing (e.g., to find a maximum size for a door), which will be helpful to select the proper 2D tools and selections. Roughly speaking, a 2D drawing is made up of Line ("linear"), Arc ("circular"), and Polyline ("poly" or "polyline"). These tools work together to create complex shapes. Tips for 2D Drawing: Use the Move tool to move your section through the drawing. For more detailed instructions, check out the 2D Drawing Tips. AutoCAD offers two types of sectioning: Drafting and Linework. When using the Drafting section, you see a "magic line" that indicates the boundary for the section. Select the entire section with a single click of your mouse, and you will see a new line appear indicating the boundary for the section. To add lines to the section without drawing a line, simply highlight the path that you want to select and type "Sketch Line" (on the keyboard). The line will appear along the path that you highlight. You can also start the sketching process by pressing Shift+S and selecting a path. To break up the line drawing, press Shift+T and select the type of line. In the sectioning area, use the menu bar to select the correct section type and check the option you want to use. You can also select Drafting from the section toolbar. For more help, click the help icon (top left). When using the Linework section, you don't see a magic line. You simply need to highlight the path you want to select. As

Markup support for adding layers, including groups, filters, and layersets, into a standard drawing. For example, you can add layers based on distance to existing drawings. (video: 1:20 min.) You can now quickly add a new line to your drawing. The AutoLISP routine will add it at the end of your drawing. (video: 1:28 min.) Markup of elements and layers is now easier. Add a second element or rotate a layer. (video: 1:30 min.) Intelligent assistance when you edit your drawing. When you edit an existing object, the "modified" data is now shown in the DDL file. You can see what AutoCAD thinks you are changing in your drawing. The new AutoLISP routine "updateModified" can correct errors when you make changes to your drawing that do not agree with what the program thinks you are doing. (video: 1:36 min.) You can specify what parts of your drawing will be automatically inserted when you create a new drawing. (video: 1:42 min.) You can now control which elements and layers are shown in your drawing by creating and editing your own options. (video: 1:45 min.) You can create and edit your own layers and options to control your drawing view. (video: 1:48 min.)
