CADGuru supports DXF manipulation in AutoCAD. CADGuru also supports CADRX. Parts of a drawing file that are linked to an entity are described by a Linked entity set (LES). AutoCAD has a variety of LES and supports a large number of entity types. For example, a sheet set of a 3D model would have an entity for each sheet, part, hole, face, edge, surface, edge primitive, beveled edge, beveled face, beveled edge primitive, beveled face primitive, patch, curvature, complex part, surface, face, edge, beveled edge primitive, beveled face primitive, mesh. Information can be associated with a CAD drawing by directly adding annotations to a drawing file. In some cases, annotation are permanent, and are an integral part of the drawing and are not created or updated by the user. In other cases, the annotation may not be permanent, but rather can be removed after some predetermined time period or some other condition is met. The annotation can be created using the Drawing toolbar, Object toolbar, the menu bar or the keyboard shortcuts. Annotations can be stored within the drawing file in several different types of storage. There are several types of annotation objects that can be defined: Annotation – a tag object that is used for a dynamic, re-entrant annotation. It is stored in a TAGS (Annotation Tag) data type object and has an AutoCAD tag name, either an English string, a short text, or a custom string. Relational Annotation - a tag object that is used for user-defined re-entrant annotation. It is stored in a RELATIONSHIPS (Relation Annotation Tag) data type object. Attributes – an object that stores user-defined information about a specific annotation. It can be defined with an Attribute text type and an Attribute name. It also stores a user-defined value for the annotation. The user can create any number of annotations. In addition, annotations can be shared between drawings and stored in a drawing file. The annotation can be stored in the drawing file in the following types of data storage. (a) Annotation and Attribute – it stores user-defined information about the annotation and its value, such as the annotation name, user-defined title, userdefined description, and user-defined value a1d647c40b

The invention relates to a clamping fitting for detachably connecting a container, in particular a drum, to a spindle. Clamping fittings for detachably connecting a drum to a spindle are known in numerous embodiments. The spindle has a bolt, which on the end side is provided with an oblong opening that allows the drum to be engaged, and which on the side facing away from the opening is provided with two or more oblong cutouts or recesses in the direction of the opening. On the drum side, the drum is provided with recesses that correspond to the cutouts or recesses of the spindle. In this way, the bolt can be inserted from the spindle and can be mounted into the drum. In order to be able to determine the appropriate screwing in of the bolt, it is necessary to determine the distance of the cutouts or recesses of the spindle from the drum. In the case of a drum that is on the order of magnitude of 1000 millimeters, the distance is normally determined by the average length of the cutout or recess. On the other hand, in the case of a container having a diameter on the order of magnitude of several hundred millimeters, the corresponding cutout or recess also has to be opened, and in order to determine the required distance, the average length of the opening has to be taken into consideration. This makes it necessary to provide two different diameters for the containers. EP 1 459 918 B1 describes a method for determining the opening of the cutout or recess of the bolt, in which an appropriately dimensioned mounting plate is introduced into the opening of the bolt. The mounting plate is then moved onto the drum and is held there. The axial position of the mounting plate is then determined by means of an optical system, and the distance between the mounting plate and the drum is measured. The mounting plate and the optical system used are relatively complicated and expensive. Munich, Germany is about to
