The high molecular mass deacetylases (approximately 100 kDa) deacetylate both deoxynucleosides and nucleosides. We have previously shown that the deacetylase is distinct from nucleoside deoxycytidine deaminase (reverse deaminase) and also that the specificity is different from the other known deacetylases, the cytoplasmic deacetylases. In this study, we investigated the substrate specificity of the mouse spleen deacetylase, which has not previously been reported. The mouse spleen deacetylase has a broad substrate specificity and is able to hydrolyze nucleosides and nucleoside deoxyribonucleoside analogues: cytidine (K(m) (app) = 9.3 +/- 2.1), deoxycytidine (K(m) (app) = 9.3 +/- 3. c6a93da74d
