Facial recognition is a nifty tool that was introduced in Lightroom 5.3. To use this feature you have to place a face, which should be understood in different ways. First of all, it can be an image imported from a camera that has facial recognition features, or a template that is accessed from All Photos. Thus, if you are familiar with a format from a camera that has facial recognition, you no longer have to wait for Lightroom to scan your face. You can also import photos that have the face recognition in them in the name of a known person. Of course, the verified items are located in your All Photos library, so you can see them when you preview all your images. If you are a Lightroom user, then you are familiar with the popular image organization features. However, there are new a few new options. It is possible to temporarily forget about the default Lightroom settings and replace them with some settings for a specific album, library or project. It's also possible to pause the importing of images. Finally, the user has a great opportunity to add shortcuts to the main screen, resize the application and use the zoom tool. Hey, Lightroom 5.2 is new, but is it any good? I will tell you my opinion—it's fast, it's stable, it's easy to use, and I am happy. There is also a price tag attached—lightroom.adobe.com/shop/photoshop-photoshop-c/ on Adobe's website. I have also downloaded the Windows version. \$750 might seem a little too steep, but if you are a 1-2 images a week photographer, I see no problem with it. If you are a professional photographer, and you work on many photos a week, and they are quite large, then you should definitely look for a better solution, because Lightroom will not be as efficient as Photoshop. But if you use it just for single images, or if you don't use video editing, Lightroom is great.

Create a new drawing layer in Photoshop using the Create a New Layer function. Let's see what we can do. Fill the new layer with a solid color and use the options available to change the color. You can increase the opacity of the layer by using the Opacity option. Since we're using different blending options, we have to understand and work in a different way. You can use a standard brush to blend everything, or you can use the Blend tool. The Blend tool has a highlighted brush for the selection, and you use the A, B, and C keys to choose what to blend. Continue clicking and typing until everything blends together. The new page, which will appear, lets you choose a new image or a photo. In the top-right corner, click Browse to open up the folder where you want to add the picture. The new file will start to load, and will be added to the current page. The picture needs to be opened and be named with a.jpg format. Let's turn on the Deselect Shape tool if it's turned off. To do this, click on **View > Show > Show Deselect Shape**. If you don't see this option, click on **View > Show > Show Deselect Shape** by default, it will be hidden. Let's say that you do not use the masking option. To add an expanded selection in Photoshop, click on **View > Show > Select Shape Tool**. If, for any reason, the Select Shape tool is already being used on the document and you can't use both tools, let's alternatively turn on the Deselect Shape tool. To do this, click on **View > Show > Show Deselect Shape** e3d0a04c9c

With the new “Share for Review” feature, you can quickly collaborate on projects from within Photoshop. Whether on a mobile device or a professional desktop, you can open or select an image that was captured recently at light speed with Adobe Sensei AI while automatically detecting the quality of the camera that captured the image. Adobe Sensei AI then gives you the option to select any of the thousands of quality cameras currently available today. Adding a new media from the Comments panel opens a new “Share for Review” box, which allows others to not only access the original photo, but also the original camera that the image was captured from, enabling them to directly comment. “Share for Review” is available immediately, without a code, on supported iOS and Android devices. And, of course, if you do want to share the image on your network or via a file transfer protocol, you can still do this too. “Share for Review” uses the same privacy-focused technology that allowed it to detect and warn users that photos were being shared to select the most appropriate cameras for Photos and videos, providing the best image quality from the most appropriate camera for each scenario. There’s also a range of powerful features to help you retouch an image in the new “Photoshop Features” window , including Adjustment Layers, Custom Colors, Layers, Harmonic Blending, Gradient Map, Screen Content, and more. Some features that new version will add are linked here: **Photoshop Elements makes it possible to share your scanned documents and photos with friends in high-fidelity formats such as .jpg, .tif and .tiff.**
