Category:Sound librariesCutaneous Electrography in the Diagnosis of Peripheral Nerve Entrapment Syndromes. Cutaneous electrography (c-EG) is a non-invasive diagnostic technique that exploits the skin-surface electrical characteristics for the diagnosis of peripheral nerve entrapment syndromes (PNES) and other neuromuscular disorders. This technique has been used in the diagnosis of different nerve pathologies and for risk stratification of patients with these conditions. To date, much of this work has been based upon the small body of research available in the academic and clinical literature. This narrative review examines current understanding and applications of c-EG as a tool for the diagnosis of PNES and for assessing risk in PNES patients. Expert commentary: While there is a dearth of robust evidence, emerging research indicates that c-EG is useful for the diagnosis of PNES. The overall level of evidence is strongest for carpal tunnel syndrome, but there is a significant amount of promising evidence to support c-EG in the diagnosis of PNES and risk stratification of PNES patients. More rigorous research is needed to validate c-EG as a diagnostic tool for PNES.1.

Field of the Invention The present invention relates to a fiber-optic gyroscope which uses bending of the fiber as a resonator to detect the rotation. 2. Description of the Related Art In recent years, research and development on fiber-optic gyroscopes, in which light is transmitted through a fiber and detection is performed in a direction perpendicular to the fiber, has been actively carried out. Fibers in which silica glass is used have been reported in many cases. In silica glass, a bending loss is lower than that of quartz glass or silica glass doped with rare earth elements which are used for rotation sensing in quartz vibrator gyros or silica fiber gyros, and there is an advantage that a high sensitivity can be obtained. A method to detect the intensity of an optical resonance phenomenon has been known as a method to measure the angular velocity or angular displacement of the fiber-optic gyroscope. This method has a problem that the measurement of the intensity of light is difficult because
