The first major change for the new Lightroom is the move to the Apple platform. This changes everything for the better in that I can now use it on any platform, including Linux. But it also represents a potentially big change in Lightroom's role in the small number of people that use Photoshop on Linux. Photoshop users represent only 0.01% of the worldwide population, and software companies have probably never heard from them until lately, especially since the Internet makes the world much smaller than it was a few years ago. It just seems a little odd to make such a big, perhaps permanent, change to the product for so few users. There is a lot that works better in the new version. With the new OS, you can also use Lightroom 5 on larger-screen Macs, which allows you to edit your photos with a broader view. Photos are about 8 megapixels now, the same as in pictures taken with a smartphone, regardless of which camera was used. On paper, that's a huge leap. It would have been nice to see Photoshop's features expanded often enough to keep users from having to do everything more slowly—or worse, find new software.

How to Undo in Adobe Photoshop

Every good designer knows the basic principle that cannot be unlearned - you hit the Delete key and 'polly' jumps in to fill the void.
