The new standard in graphic design software has arrived on the Mac. The latest version improves performance on Mac hardware by dropping frames and increasing feature parity between it and the Windows and Linux versions of Photoshop. The biggest improvement for me is the improved video editing tools in the latest version. Editing videos is a pain on a Mac, but the new features restore the workflow that should be expected from a professional digital photographer—from removing and replacing clips to adding titles. Improving image quality is one of the core objectives for this year's release. The new features aim to help lighten up portraits and make brighter skies, but also lower the noise, improve skin tones and ease the color of skin in portraits. The order of the table is very stringent. While the overall speed of the software is very high, some functions are just that bit slower than they were years ago. It almost seems ludicrous to think that this has been the case for all those years, but now it hasn't been. For instance, to repair an image one must make a selection of all the areas to be changed. That's still a pretty lengthy process and it's one of the main reasons and justifications for using a Clipboard to make changes. The software also has been missing some very key features that add efficiency to using the application. For instance, a Custom Clipping Pane would be a Godsend in editing and measuring. The current version does support Live Preview and After Effects-like Live View, but there's a simple clip tool that I need. The latest version of Photoshop is also lacking a more intuitive search tool. What I find most infuriating is that a lot of the last few versions of the software are the exact same when it comes to quality.

In addition to the new features just announced, you can also expect additional enhancements, feature and updates, which will be announced at the individual product or application product teams. The most important feature, which will be announced at MAX, is Photoshop Layers. We will announce details of the Photoshop Layers coming in 2019. Last year's release of the Adobe Photoshop CSX desktop app came in the middle of what has become an annual update spree that was topped this year by Photoshop CC 2017, which also introduced a new content pipeline that makes importing or bypassing the compressed single file (.PSD) format standard. After the app's release, the industry went into shock as all Photoshop vendors nearly simultaneously announced that they would end support for the old format in a matter of months. So far, all have followed suit, although Photoshop CC 2019 actually merely moves the deadline to Oct. 1, 2020--a global lock-in period for Adobe as a company, despite the status of a force majeure event for Photoshop's customers. The result is that photographers who already use the new format are in the unenviable position of fighting with themselves over whether they're late to the digital game at the expense of their own editing choice, and there will likely be no easy path to learning how to use the newest version of Photoshop. This year, Photoshop CC 2019 came with a focus on comics, animation, and video editing, for which Adobe brought in two new editors. There is a "Marvel" version and a "Cartoon" version. And both of them include the option to order a subscription for the app. The Photoshop CC 2019 app is the first version of the desktop application to support the new 2023 version of the software, which brings several big changes in terms of AI, dialogue boxes, watercolor manipulation, and a host of new features.
