Program Features Macro programming The CAD applications contain a large number of commands which allow a user to perform tasks repeatedly, such as using a template to draw lines, squares, circles, arcs, and curved paths. Macros are used by programmers, and by designers and operators who repeatedly use the same commands on many drawings. Feature databases The design database in AutoCAD contains a variety of objects that are used throughout the CAD environment. These include: lines arcs arcs bulges fillets planes textures solids extrusions extruded faces base, top, front, and back faces building blocks schematic symbols create, erase, and classify commands AutoCAD also contains a design library database of geometric objects which can be used as the basis for new drawings. In addition, AutoCAD contains a detailed file-based configuration database of every element in the application and every option in the user interface. The file-based configuration database is used by AutoCAD to create drawings from predefined templates or from one of the many preconfigured object types. The task databases in AutoCAD contain AutoLISP macro commands which automate the creation of certain drawing processes, such as creating and modifying properties or dimensioning on curves or faces. Other databases include the desktop database, which records the state of every window in the application and can be used to restore windows to their previous state, and a directory database which keeps track of the relationship between the files in a project and the applications used to modify the files. Work Space Work space is the term for the main AutoCAD screen and the window in which the user draws or works. When you start up AutoCAD, the default work space is the application screen.
